

Source Control - Check List	Status
Is the project using source control? (It must be. No buts.)	[]
Is it easy to create a full working instance after checkout/clone?	[]
Is there a database initialization script in the repository? (Database structure must be under source control, too.)	[]
Do people pull/fetch/update before committing? (Most source control systems force you to, but not all. One should always integrate before commit.)	[]
Does every commit contains only one modification (a feature, a bug fix, etc)?	[]
Does every commit have a description? (Nobody will remember in three months what "today's work" was.)	[]
Was the new code tested (and automated tests run) before committing? (At some places, the person who commits code that breaks the compilation/autotests.)	[]
If the database needed changing, was the db creation script modified and committed (preferably, together with the code changes)?	[]
